Robot Kuka KR180-3 Series 2000 weight 1053 kg Em90ysr payload 180kg control VKRC2 Control cabinets.The present invention relates to a hydraulic operating cylinder for machine tools. One known hydraulic operating cylinder for machine tools consists of a housing having an end wall connected with the housing of a driven spindle, and a moveable piston disposed in the housing and driven by a servomotor. The piston is connected by a piston rod to an operating tool, such as a drill or a milling cutter, and moves the tool in a direction that is parallel to the axis of the cylinder. The operating cylinder, and in particular the piston and the piston rod, can be displaced in the direction of the axis of the cylinder by the pressure of a hydraulic medium, such as oil, that is fed in through a pressure medium supply. In these known operating cylinders, the piston usually has a cylindrical body through which the piston rod extends, and a flat piston plate which is elastically connected with the body and forms the piston face against which the end face of the tool is pressed. An end of the piston rod is connected with the piston rod while the opposite end of the piston rod is connected with the end wall of the cylinder. In the case of these known operating cylinders, it is possible to displace the tool only in a straight line (parallel to the axis of the cylinder). To bring the tool into a desired angular position, an angular displacement of the tool and of the associated driven spindle and operating cylinder, as well as of the piston and piston rod, is therefore required. Due to this angular displacement, this known operating cylinder requires a space which is greater than that which is required if the tool is to be displaced straight to the position in which a machining operation is to take place.1. Field of the Invention The invention relates to a system including an actuator and a sensor. More particularly, the invention relates to a system including an actuator and a sensor for displacement control of an optical element, such as a lens. 2. Description of the Related Art In an optical disk device, a tilt detector/controller (DTC) detects and compensates for a tilt or inclination of an optical disk (DVD, CD, and the like). By the compensation, an optical beam spot is uniformly formed on the disk to read
